CARBON

**PSYCHOSOCIAL SCARS
 OF CONFLICT ON CHILDREN**

In high-threat contexts, weaponized violence, spatial displacement, and situational loss can precipitate perceptual stimuli that exceed the body's regulated capacity of response. In such situations, the body engages intelligent mechanisms of self-protection. Effectively compartmentalizing and fragmenting internal experience, it creates a rupture by dissociation, shuttering off a portion of awareness whilst sustaining some aspects of selfhood to persevere in the face of adversity.
